OBJECT ORIENTING DESIGN

Most software today is very much like an Egyptian pyramid with millions of bricks piled on top of each other, with no structural integrity, but just done by brute force and thousands of slaves

Alan Kay

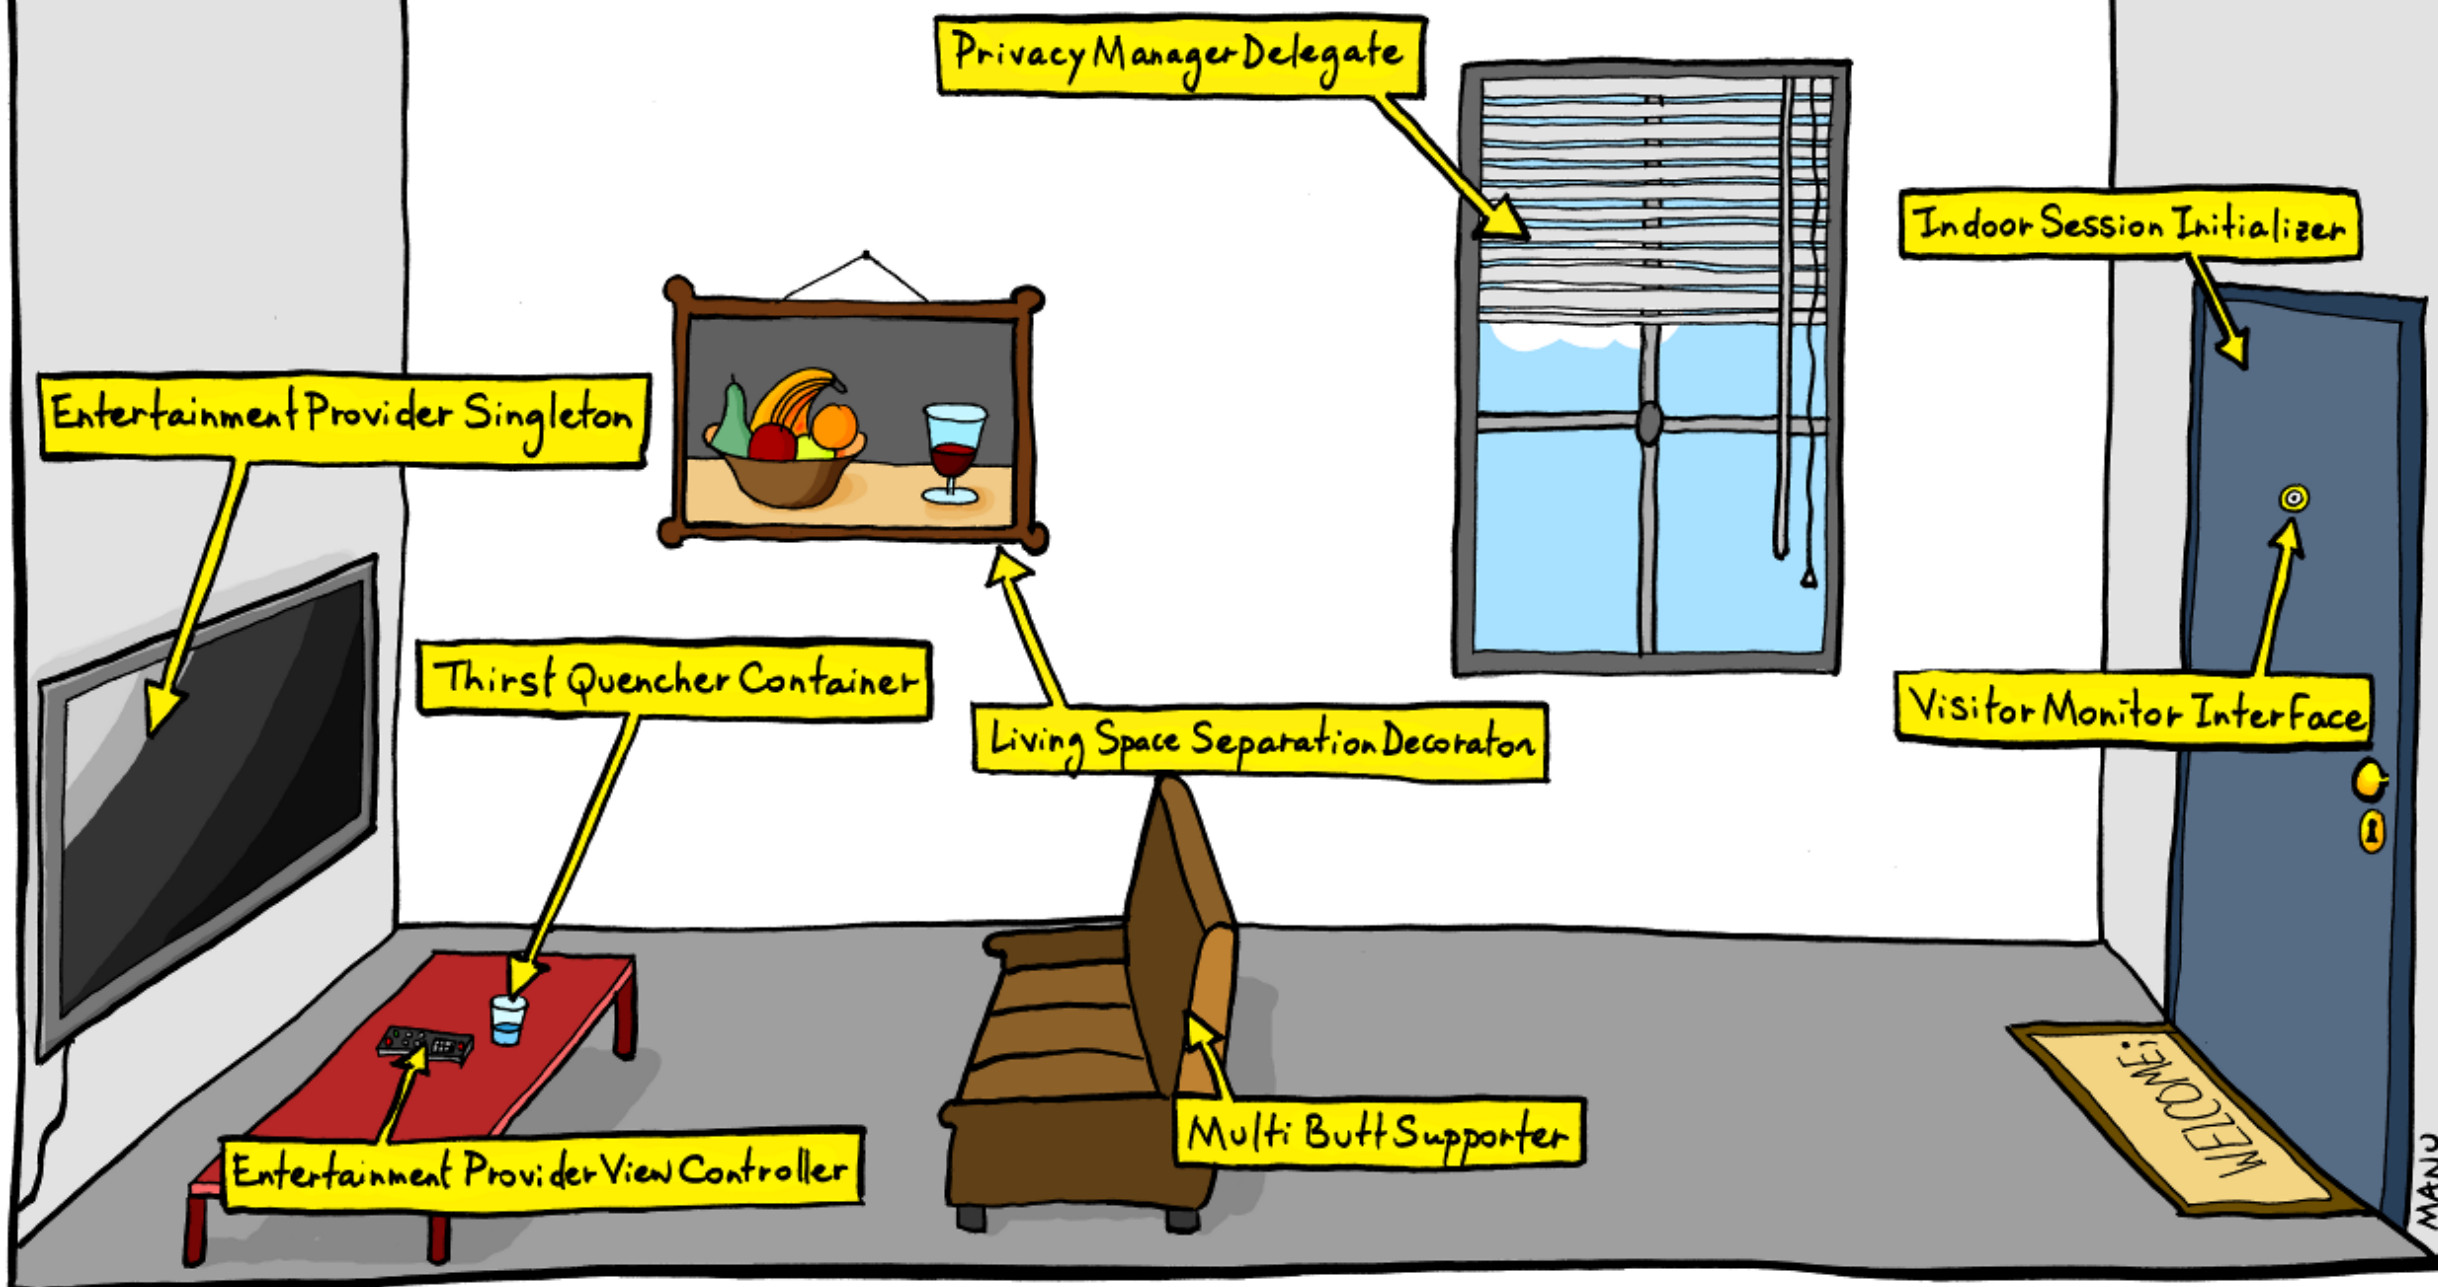

Industry standard OO It's not OO

**Data do not perfectly represent a real world
object**

**Data has to be used in many more inter relational
ways than OO pretends**

**When you hide your data behind a class you are
force to re implement
basic things that are already available to the
language.**

THE WORLD SEEN BY AN "OBJECT-ORIENTED" PROGRAMMER.

[Over engineered future ready
for flying also when required 😊]

**Abstractions should proceed experience not
precede it**

**The only pattern that should arise from looking at
your source code is patterns
of your domain.**

OO is really bad for concurrency

How to minimize the dependency by using callables.

How to use currying as a dependency injection scheme.

REFERENCES

This is the conundrum at the heart of object decomposition. Every behavior can be re-contextualized by swapping around the subject, verb, and objects. Senders can send messages to Recipients; Messages can send themselves to Recipients; and Recipients can receive messages.
